

Amazon.de Seller Workbook v4 — User Manual

v4 · 2026-08-25 · internal, future in-app help content for easestore.de · companion to the Sheet 1 (Seasonality) manual

What the file is: one workbook that walks a product from idea to funded order to monthly operations. Sheets are numbered in the order you should use them; every sheet links back to Start, and Start shows a live one-line status per sheet. Blue text on yellow = you type. Black = formula, never overwrite. Green = pulled from another sheet.

1. The funnel — which sheet, when

Phase	Sheets	Question each answers
Choose the product	1 → 2 → 3 → 4 (5 to compare niches)	Is demand real and rising? Is the season still reachable? Does a unit earn enough? Does it pass every compliance and competition gate?
Fund the launch	6 → 7 → 8	How many units? What can ads cost, and what does the launch push cost? Does the 12-month cash line stay above zero?
Operate	9 · 10 · 11 monthly, 7 every two weeks	Real monthly profit; money Amazon owes you; the complaint to attack next.
Plan the business	12	Do 2–3 staggered launches over 3 years stay funded — or do they collide in a cash crisis?

A hard NO in Sheet 4's block A ends the candidate regardless of every other number. That is the point of the order: the cheap checks (1, 4A) run before the expensive ones.

2. What is new in v4

Where	New block	What it tells you
Sheet 12 (new)	Multi-year plan, 12 quarters, up to 3 products	Whether the LAUNCH SCHEDULE is funded — not one product, the business.
Sheet 4, rows 38–44	Review wall in months	How many months of grinding until you match page-1 median review counts.
Sheet 4, row 46	Textile / plant-material reminder	Fibre labelling (EU 1007/2011) and phytosanitary risk for plant fillings — check BEFORE sampling.
Sheet 6, rows 35–41	P10 / P90 helper	Turns Cerebro keyword sales + a realistic position share into the two demand inputs the order-size model needs.
Sheet 7, I5:J10	CPR launch-push cost	Order-of-magnitude cost of pushing to page 1 on one keyword: units burned + 8 days of ads.
Sheet 8, rows 37–38	Cash cycle & cash turns	How long each euro is locked up, and how many times a year it can work.

3. Sheet 12 — the multi-year plan

Why it exists. Sheet 8 proves one product survives its first year. But real accounts die at product TWO: each launch locks ~6 months of cash exactly when the previous product is still ramping. Sheet 12 makes that collision visible before you commit.

- **Global inputs:** starting cash (pulled from Sheet 8), fixed costs per quarter (subscriptions, EPR fees, accountant), and the ramp share — a product sells 40% of its mature rate in its launch quarter, 70% in the second, 100% from the third.
- **Per product (up to 3 columns; leave a column empty to plan fewer):** launch quarter (1–12), mature units per QUARTER (not month), payout per unit after tax (product 1 pulls Sheet 3; for others run Sheet 3 per product and type the result), landed cost, one-off launch cash, ongoing ads per unit.

- **One-off launch cash** is everything spent before the first sale: the first order, GPSR responsible person, LUCID/PPWR, photos, Vine, launch-phase ads including the CPR push (Sheet 7). It leaves the quarter BEFORE the launch quarter — goods take about a quarter to arrive.
- **Stock is bought one quarter ahead:** each quarter pays for the NEXT quarter's units. The first order is not double-counted — it sits inside the one-off.

Read one number: the lowest cash point (C32). Negative = the schedule as typed is NOT funded — push a launch one or two quarters later, shrink an order, or add capital. Positive = its size is your real buffer. **The file ships with a deliberate warning:** the example launches product 2 in quarter 3 on a €6,500 start and dips to about -€3,400 in quarter 2 — showing exactly the crisis the sheet exists to catch. Move product 2's launch to quarter 5 and watch the line clear zero.

The structure follows the integrated model taught in Helium 10's Freedom Ticket financial module (units → cash → minimum cash, staggered launches); every economic number in it is this file's German reality: deemed-supplier payouts ex-VAT, duty on CIF, 1% Georgian turnover tax.

4. The five v4 upgrades, in use

Review wall (Sheet 4, rows 38–44). Enter the MEDIAN review count of page-1's top-10 (median, not average — one 5,000-review giant distorts an average), your expected units/month, and a review rate (1–2% of units is normal organically). The sheet converts the wall into months. Bands: ≤6 months OK · 6–12 CAUTION (budget PPC above target ACOS for that long) · >12 FLAG — you need Vine plus a real differentiation angle from Sheet 11, or a lower-wall niche. Default example: 75 median ÷ (300 × 1.5%) = 16.7 months → FLAG.

P10/P90 helper (Sheet 6, rows 35–41). The newsvendor model is only as good as its two demand inputs. Feed it Cerebro's keyword sales per month (parent + main children, don't double-count), the months you're stocking, and a captured share. The defaults 4–15% come from position economics: positions 1–3 take ~40–60% of clicks, 4–8 take ~15–25%, page-1 bottom under 5% — a new launch realistically lands mid-page. The helper only SUGGESTS: sanity-check against Xray page-1 unit sales, then copy into C6/C7 by hand.

CPR launch push (Sheet 7, I5:J10). Cerebro's CPR estimates the units in 8 days needed to reach page 1 for a keyword. Cost of the push = CPR × (landed cost + launch discount) + 8 days of launch ads. It is a heuristic — read the total as an order of magnitude. If it exceeds roughly 6 weeks of expected page-1 contribution, attack a cheaper child keyword first. Add the result into Sheet 12's one-off.

Cash cycle & turns (Sheet 8, rows 37–38). Cycle = full supply lead time (Sheet 2) + ~45 days sell-through + ~14 days payout lag. At ~190 days that is ~1.9 turns/year: each euro completes the loop about twice — so a 40% per-cycle margin compounds to roughly 76% a year on working capital, and cutting 3 weeks off the supply chain can beat a price increase.

Textiles & plant fillings (Sheet 4, row 46). Any textile needs fibre-composition labelling per EU Regulation 1007/2011 — defined fibre names only, marketing names on the label are illegal. Plant fillings (buckwheat, spelt — e.g. japanisches kissen) add phytosanitary import risk: confirm the filling's import status before paying for samples.

5. Common mistakes with the new blocks

- Entering monthly units into Sheet 12's 'units per QUARTER' row — everything triples.
- Typing P10/P90 straight from the helper without the Xray sanity check — Cerebro keyword sales overlap across keywords.
- Treating the CPR total as a precise budget instead of an order of magnitude.
- Averaging page-1 review counts instead of taking the median for the review wall.
- Leaving the shipped Sheet 12 example untouched and reading its ■ as your own verdict — replace the yellow inputs with your plan.
- Forgetting that Sheet 12 smooths seasonality: a Q4-heavy product needs Sheet 8's monthly view on top.
